Very generic topical overview, no real analytical discussions

By Doctor Gangreene

I bought this as a "required" text for a groundwater hydrogeology (contaminant transport) class. The class is highly dependent on partial differential equations, incomplete integrations, Bessel functions, leaky aquifer functions, etc. It's VERY numerical in nature and it involves a LOT of higher level calculus and differential equations. Tons of mathematical derivations of different formulas to describe contaminant activity in groundwater. And I haven't done any calculus in 13 years so my math skills are a little bit rusty.

It turns out that this book is only full of basic overviews of various topics related to groundwater contamination. It does cover a wide range of topics, from drawdown definitions to site remediation strategies. But it does not give ANY specific mathematical treatments for any of it. There are no equations. It does not define any algebraic variables. There are no mathematical examples to walk a student through the process of actually solving the problems that the book describes. So it is the exact opposite of what I was hoping for; all of the info in this book, I already know from other classes that I took last year, so now I sort of wish I hadn't wasted my money on it. As an OVERVIEW text, it is actually pretty good though. So if you are NEW to groundwater theory and you want a TOPICAL explanation of things, rather than a mathematical work-through, then this is a good choice. If you want a text to show you some equations to work through problems yourself... look elsewhere.

Great Book for Contaminant Subsurface Hydrology

By Chuks Okereke

This is definitely a must have for those with a career in contaminant subsurface hydrology. Check out chapter 3 (transformation, retardation, attenuation of solutes), chapter 8 (groundwater and soil monitoring) and chapter 9 (site remediation). Easy to read - great reference material
